# Outline/ Learning Objectives

Topic	Description
Techniques	Identify different pricing techniques and when to apply them
Assessment	Check profit impact of different prices
B2B & B2C	Explain pricing models for consumer and business markets
Discrimination	Define price discrimination and its effect on profitability

# Pricing Techniques

Acme Light Bulb Company; Used for Ongoing Example

# Pricing Techniques: Creaming/ Skimming

“Skim the cream off the top of the market”

Description: Set prices high during new product/service introduction

Example: Panasonic set high prices for its new 3D TVs during launch

Sample Calculations for Acme Example:

Acme can use creaming/ skimming for its Acme LUX premium LED light bulb

Charge \$30 for Acme LUX light bulb, even though incandescent available for \$1

# Pricing Techniques: Demand-Based

Description: Set prices to maximize profit, based on consumer demand  
Example: Amazon.com adjusts prices over time to maximize profitability

## Sample Calculations for Acme Example:

Acme carefully monitors the quantity of products it sells at different prices  
Acme has developed a demand curve, which it uses to maximize profits

# Pricing Techniques: Everyday Low Price

Description: Set prices consistently low to attract price-sensitive customers

Example: Walmart uses everyday low pricing to emphasize good value

## Sample Calculations for Acme Example:

Acme charges everyday low prices for its midline halogen light bulbs

- Avoids attracting new competitors into replacement light bulb industry
- Reduces spikes in demand for light bulbs from price promotions

# Pricing Techniques: Going Rate

Description: Set prices to align with those of competitors

Example: Gasoline stations in same area often sell gas at similar prices

## Sample Calculations for Acme Example:

Acme sells compact fluorescent lamps (CFLs) to home improvement retailers

Retailers can choose from many suppliers to purchase CFLs

Price set by “going rate” with those suppliers

# Pricing Techniques: Markup/ Cost Plus

Description: Set prices by adding percentage to unit cost

Example: Attorneys, contractors, and consumer packaged goods often use markup

Unit Cost = (Variable Cost) + (Fixed Cost) / (Unit Sales)

Variable Cost = Cost of labor & materials to manufacture each unit

Fixed costs = Costs that remain fixed as we increase the number of units manufactured

Unit Sales = Quantity of units that we sell

Markup Price = (Unit Cost) / (1 – Markup Percentage)

Sample Calculations for Acme Example:

Variable cost = \$10 per bulb; Fixed costs = \$400,000; Unit sales estimate = 40,000

Markup percentage = 20%

Unit cost = (\$10) + (\$400,000) / (40,000) = \$10 + \$10 = \$20 per bulb

Markup Price = (\$20) / (1 – 0.20) = \$25 per light bulb

# Pricing Techniques: Penetration

Description: Set prices low to attract new customers and expand market share  
Example: P&G and Unilever use penetration pricing to expand into new areas

Sample Calculations for Acme Example:

\$252 million market in CFLs in 2010

Acme could cut its price for its CFLs to penetration levels to gain market share

# Pricing Techniques: Prestige Pricing

Description: Set prices high to signal high quality or status

Example: Rolex sets prices very high to align with its luxury brand

## Sample Calculations for Acme Example:

Acme could apply prestige pricing to its Acme LUX LED light bulbs

Differentiated through its high illumination levels and natural spectrum lighting

# Pricing Techniques: Target-Return Pricing

Description: Set prices to achieve company-defined return on investment

Example: Industrial supply companies often use target-return pricing

Unit Cost = (Variable Cost) + (Fixed Cost) / (Unit Sales)

Variable Cost = Cost of labor & materials to manufacture each unit

Fixed costs = Costs that remain fixed as we increase the number of units manufactured

Unit Sales = Quantity of units that we sell

Target-Return Price = (Unit Cost) + (Target ROI) \* (Investment) / (Unit Sales)

Sample Calculations for Acme Example:

Variable cost = \$10 per bulb; Fixed costs = \$400,000; Unit sales estimate = 40,000

Investment = \$800,000; Target ROI = 20%

Unit cost = (\$10) + (\$400,000) / (40,000) = \$10 + \$10 = \$20 per bulb

Target-Return Price = (\$20) + (20%) \* (\$800,000) / (\$40,000) = \$24

# Pricing Techniques: Tiered

Description: Set prices at different price points for different levels of features

Example: Big O Tires offers Good, Better, and Best oil change packages

## Sample Calculations for Acme Example:

Acme LUX LED light bulbs in 3 tiers:

Best: Light output of 1700 Lumens, equivalent to 100W incandescent bulb. Price at \$30

Better: Light output at 800 Lumens, equivalent to 60W incandescent bulb. Price at \$20

Good: Light output of 150 Lumens, equivalent of 25W incandescent bulb. Price at \$10

# Pricing Techniques: Value-In-Use

Description: Set prices based on product or service's value to the customer

Example: Rhino Shield ceramic coating lasts 25 years; "never paint again"

Sample Calculations for Acme Example: See next slide

# Pricing Techniques: Value in Use

Variable	Data	Description
Existing light bulbs: Price	\$5	Price of existing halogen light bulbs
Existing light bulbs: Life	6 mo.	Life expectancy in difficult conditions
Existing light bulbs: Labor	\$20/unit	Labor cost to replace light bulbs
Existing light bulbs: Quantity	100	Quantity of light bulbs to be replaced
Acme LUX light bulbs: Price	VIU	Value in use price we wish to calculate
Acme LUX light bulbs: Life	24 mo.	Life expectancy in difficult conditions
Acme LUX light bulbs: Labor	\$20/unit	Labor cost to replace light bulbs

Example

# Pricing Techniques: Value in Use

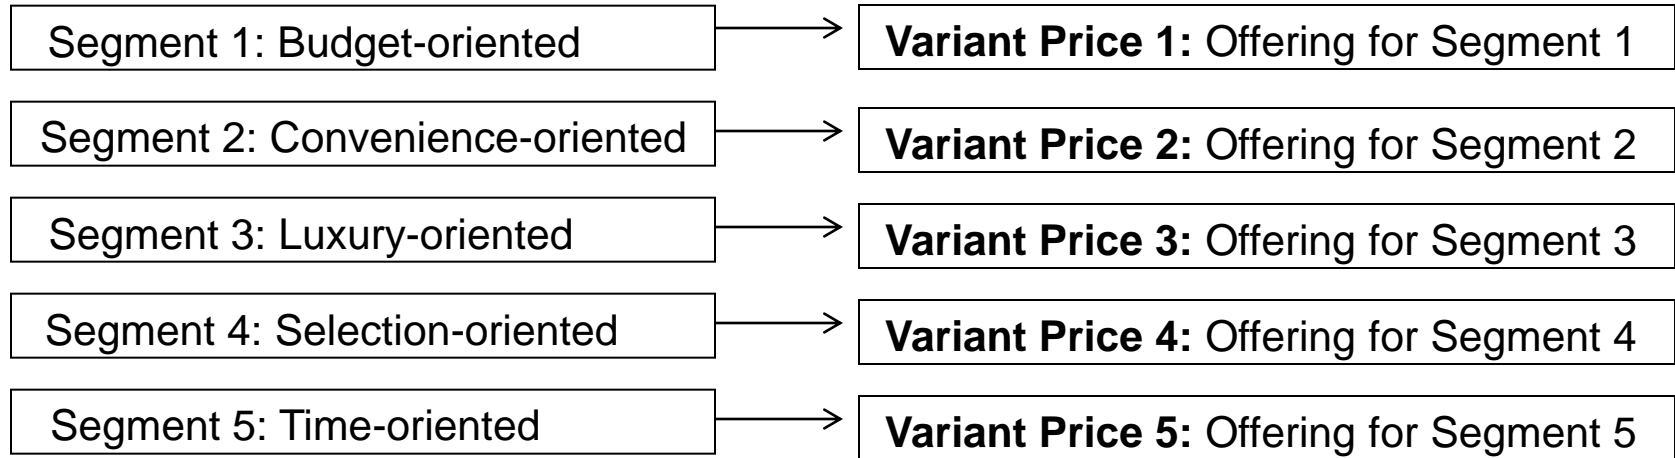

$$\begin{aligned}\text{Annual Light Bulb Cost} &= \text{Cost for Parts (Light Bulbs)} + \text{Cost of Labor (to Replace Light Bulbs)} \\ &= 100 \text{ light bulbs} * \$5/\text{each} * 2 \text{ changes/ year} + 100 \text{ light bulbs} * \$20/\text{each} * 2 \text{ changes/ year} \\ &= \$1,000/\text{year} + \$4,000/\text{year} = \$5,000/\text{year}\end{aligned}$$

$$\begin{aligned}&\$5,000 \\ &= 100 \text{ light bulbs} * \$\text{VIU}/\text{each} * 0.5 \text{ changes/ year} + 100 \text{ light bulbs} * \$20/\text{each} * 0.5 \text{ changes/ year}\end{aligned}$$

$$\text{VIU} = \$80 \text{ each for the Acme LUX LED light bulb}$$

Example

# Pricing: Variant

Description: Set different prices for different variants, for different segments

Example: Volkswagen sells different branded cars to different segments

## Sample Calculations for Acme Example:

Target durability-oriented segment; Find out what they expect

Durability-oriented segment: Wants vibration resistance and crush resistance

Acme LUX LED light bulb excels in vibration and crush

# Pricing Assessment: Break-Even

Acme Example:

Calculate fixed cost: Acme has a fixed cost of \$200,000 for the project

Calculate variable cost: Acme spends \$10 per unit on variable cost

Calculate unit cost: Unit cost =  $\$10 + (\$200,000 / 20,000) = \$20$

Select price to assess: We expect to charge \$40 per unit

Calculate Break-Even: Use the following formula:

$$\begin{aligned}\text{Break-even} &= (\text{Fixed Cost}) / (\text{Price} - \text{Unit Cost}) \\ &= (\$200,000) / (\$40 - \$20) = 10,000 \text{ units}\end{aligned}$$

# Pricing Assessment: NPV Capital Budgeting

**Example:** Acme wants to know if its proposed Acme LUX LED light bulbs will meet its organizational objective of generating 10% ROI.

- 1. Determine initial investment:** Acme expects an initial investment of \$250,000, which equates to a (- \$250,000 ) cash flow in year zero.
- 2. Select price to assess:** Acme plans to sell the units for \$40 each.
- 3. Forecast unit sales:** Based on sales of similar units, Acme forecasts sales of 2,000 units in year one, 2,500 in year two, and 3,250 in year three.

# Pricing Assessment: NPV Capital Budgeting

**Example:** Acme wants to know if its proposed Acme LUX LED light bulbs will meet its organizational objective of generating 10% ROI.

**4. Calculate cash flows:** With the price and unit quantities established, we can calculate the cash flow from the units in year one as  $\$40 * 2,000 = \$80,000$ , in year two as  $\$40 * 2,500 = \$100,000$ , and year three as  $\$40 * 3,250 = \$130,000$ .

**5. Calculate net present value:** We enter our information into the NPV equation:  
$$\text{NPV} = [ (-\$250,000) / (1 + 0.10)^0 ] + [ (\$80,000) / (1 + 0.10)^1 ] + [ (\$100,000) / (1 + 0.10)^2 ] + [ (\$130,000) / (1 + 0.10)^3 ] = \$3,043; \text{NPV} > 0$$

# Pricing Assessment: IRR Capital Budgeting

**Example:** Acme wants to know the internal rate of return (IRR) for its Acme LUX LED bulbs, and if the IRR will meet the minimum internal return of 10%.

**1. Determine initial investment::** Acme expects an initial investment of \$250,000, which equates to a ( - \$250,000 ) cash flow in year zero.

**2. Select price to assess:** Acme plans to sell the units for \$40 each.

**3. Forecast unit sales:** Based on sales of similar units, Acme forecasts sales of 2,000 units in year one, 2,500 in year two, and 3,250 in year three.

# Pricing Assessment: IRR Capital Budgeting

**Example:** Acme wants to know the internal rate of return (IRR) for its Acme LUX LED bulbs, and if the IRR will meet the minimum internal return of 10%.

**4. Calculate cash flows:** Just as with the net present value model, we calculate the cash flow as  $\$40 * 2,000 = \$80,000$  in year one,  $\$40 * 2,500 = \$100,000$  in year two, and  $\$40 * 3,250 = \$130,000$  in year three.

**5. Calculate internal rate of return:** Enter the information and set  $NPV = 0$  and solve for IRR

$$NPV = [ (-\$250,000) / (1 + IRR)^0 ] + [ (\$80,000) / (1 + IRR)^1 ] + [ (\$100,000) / (1 + IRR)^2 ] + [ (\$130,000) / (1 + IRR)^3 ] = 0$$

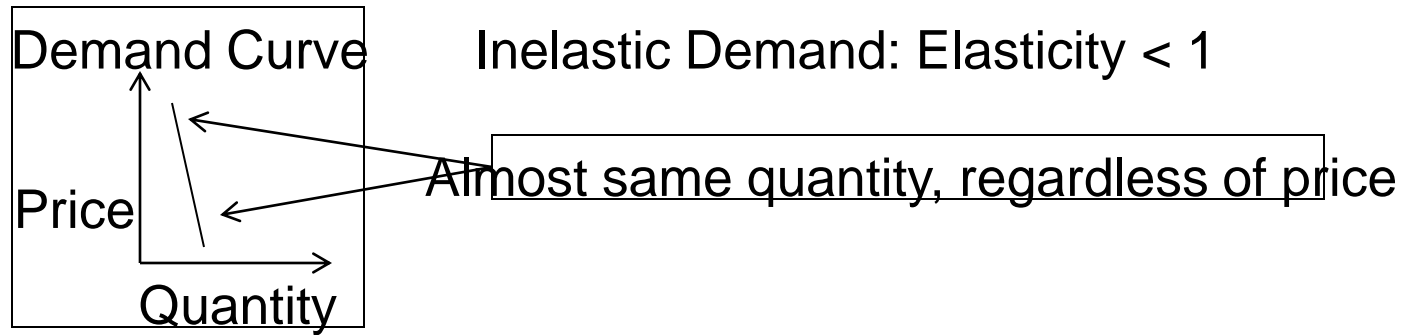

Calculating for IRR, we get 10.6%

# Demand Curves: Elastic

$$\text{Elasticity} = \frac{\text{Percentage change in quantity demanded}}{\text{Percentage change in price}}$$

# Demand Curves: Inelastic

# Demand Curves: Elasticity

Price	Quantity
\$10	5
\$20	4
\$30	3
\$40	2
\$50	1

← (P1, Q1) = (\$10, 5)

← (P2, Q2) = (\$50, 1)

Elasticity =  $\frac{\text{Percentage change in quantity demanded}}{\text{Percentage change in price}}$

$$= [ (Q2 - Q1) / Q1 ] / [ (P2 - P1) / P1 ]$$

$$= [ (1 - 5) / 5 ] / [ ( \$50 - \$10 ) / \$10 ] = -0.80 / 4 = -0.20$$

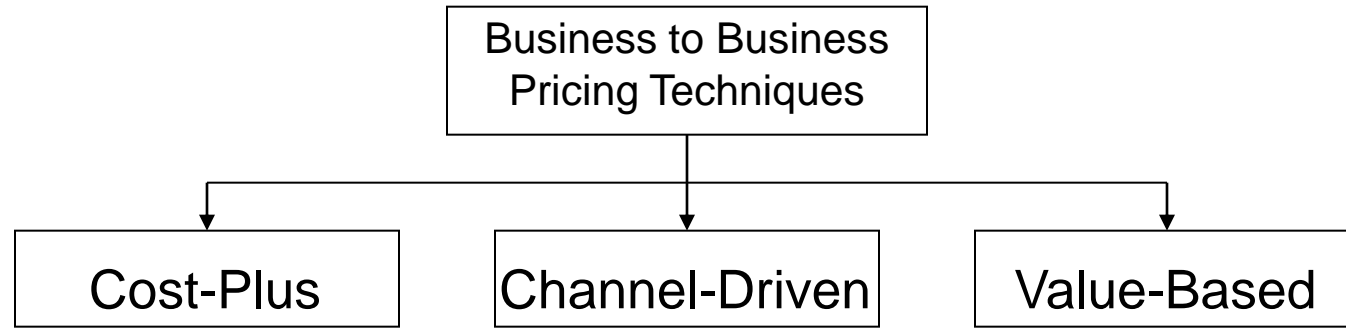

# Demand Curves: Optimal Pricing

Price	Quantity	Revenue	Cost	Profit
\$10	5	$\$10 * 5 = \$50$	$\$20 * 5 = \$100$	$\$50 - \$100 = (\$50)$
\$20	4	$\$20 * 4 = \$80$	$\$20 * 4 = \$80$	$\$80 - \$80 = \$0$
\$30	3	$\$30 * 3 = \$90$	$\$20 * 3 = \$60$	$\$90 - \$60 = \$30$
\$40	2	$\$40 * 2 = \$80$	$\$20 * 2 = \$40$	$\$80 - \$40 = \$40 *$
\$50	1	$\$50 * 1 = \$50$	$\$20 * 1 = \$20$	$\$50 - \$20 = \$30$

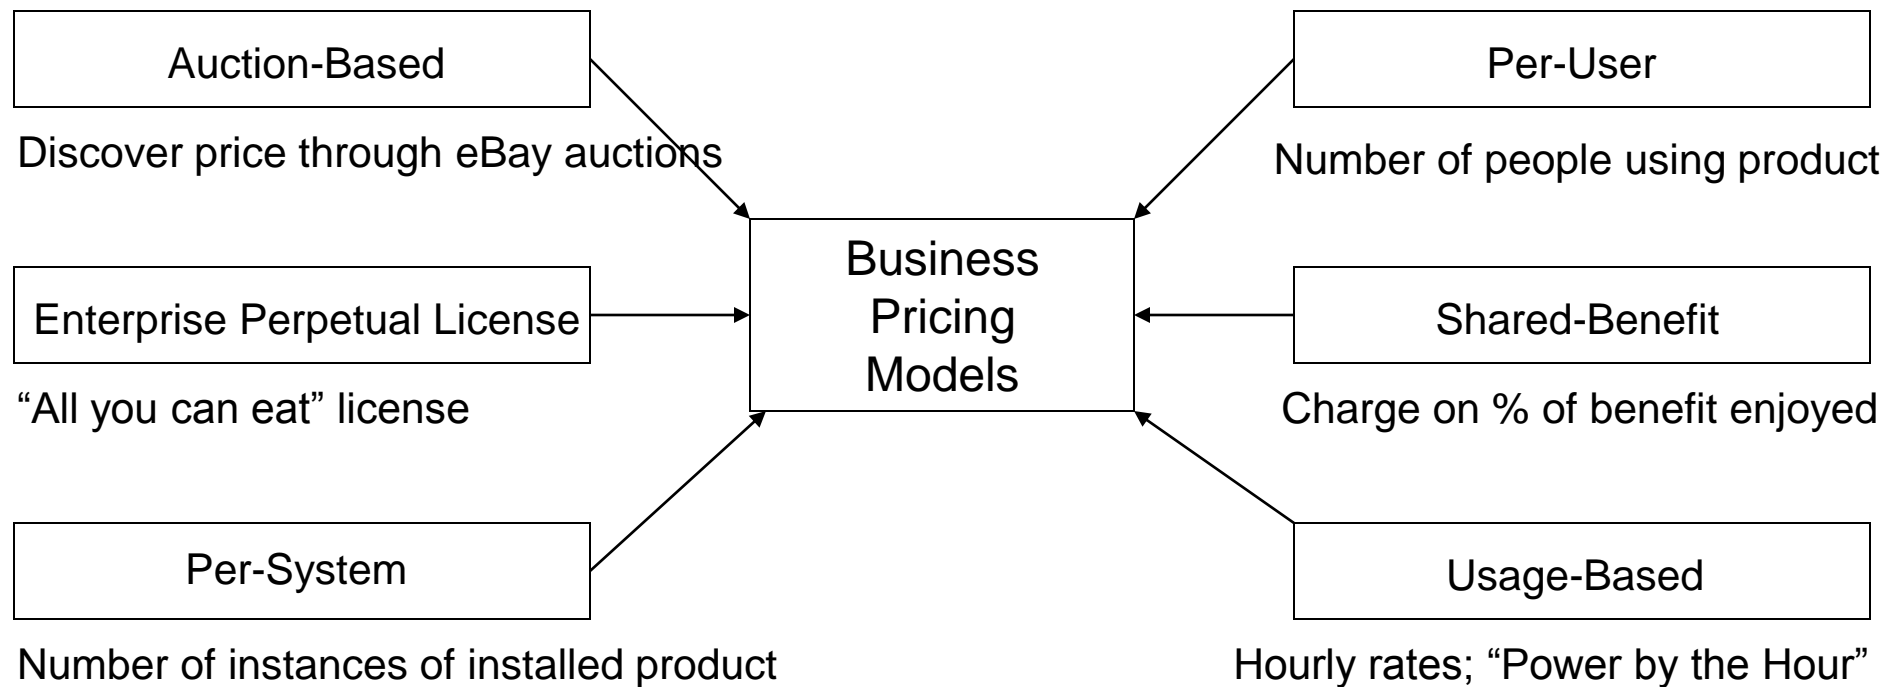

Optimal Pricing Table for Acme LUX LED Light Bulbs

Max. profit at \$40

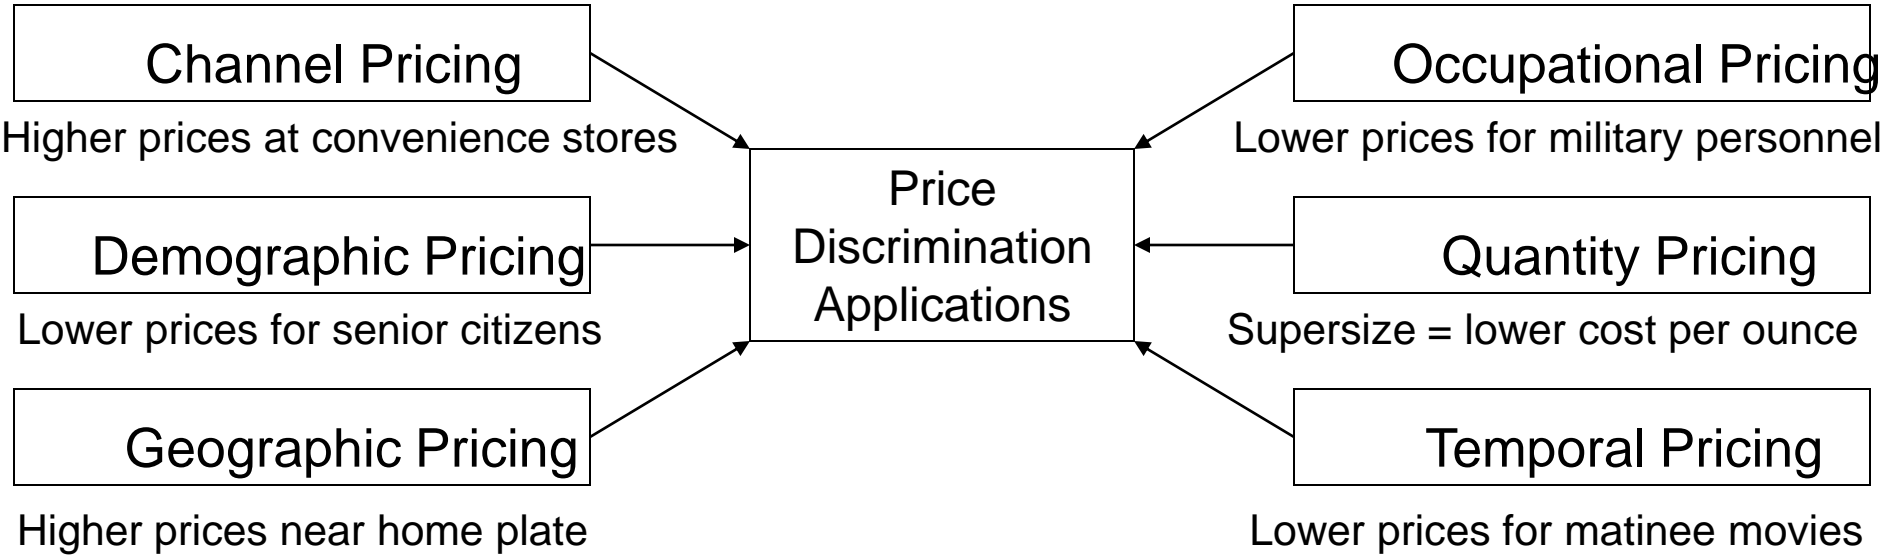

# Business Market Pricing Techniques

# Business Market Pricing Models

# Price Discrimination

# Price Discrimination

Segment	Reservation Price	Profit per segment
A: Industrial plants	\$40	$1\% * 300,000 * (\$40 - \$20) = \$60,000$
B: Retail Stores	\$40	$20\% * 46,000 * (\$40 - \$20) = \$184,000$
C: Art Galleries	\$40	$80\% * 6,700 * (\$40 - \$20) = \$107,200$
Total		$\$120,000 + \$184,000 + \$107,200 = \$351,200$

**Profit at Fixed Price** →

# Price Discrimination

Segment	Reservation Price	Profit per segment
A: Industrial plants	\$30	$2\% * 300,000 * (\$30 - \$20) = \$60,000$
B: Retail Stores	\$50	$15\% * 46,000 * (\$50 - \$20) = \$207,000$
C: Art Galleries	\$80	$60\% * 6,700 * (\$80 - \$20) = \$241,200$
Total		$\$60,000 + \$207,000 + \$241,200 = \$508,200$

**Profit at Varying Prices** →

# Check for Understanding

Topic	Description
Techniques	Identify different pricing techniques and when to apply them
Assessment	Check profit impact of different prices
B2B & B2C	Explain pricing models for consumer and business markets
Discrimination	Define price discrimination and its effect on profitability
